Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 9.863; Variance 5.746; scale 1.716

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Human Notch and Delta DNA and protein sequences - used for study and manipulation of differentiation processes Claim 50; Fig 13; 239pp; English.

The sequence given represents the nucleotide sequence of human Delta gene contained in plasmid cDNA clone Dll. A human expression library was constructed and screening assays were carried out on to select for the expressed Delta product. Alternatively the sequences could be isolated by amplification using polymerase chain reaction (PCR) primers. The isolated gene may be inserted into a cloning vector and expressed. The Delta gene and also the Notch and Serrate neurogenic genes are designated "toporythmic" genes. The proteins they encode are involved in specific homo- or heterotypic interactions crucial to differentiation. The quantitation of mRNA for human Notch and Delta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-MAY-1992; U03651.

Disclosure; Pages 84-85; 119pp; English.
Delta encodes an approx. 100 kd protein (Delta denotes 'DLZM', the protein product of the predominant zygotic and maternal transcripts) that has nine EGF-like repeats within its extracellular domain. Molecular studies have lead to the suggestion that Notch and Delta constitute biochemically interacting elements of a cell communication mechanism involved in early developmental decisions.

The C-delta-1 gene (T58898) codes for the chick homologue (W00876)
The C-delta-1 gene (T58898) codes for the chick homologue (W00876)
of Drosophila Delta, a protein that binds to Notch protein. It was obtd. by PCR amplification of CDNA from stage 4-6 embryos using primers (see also 759455-56) based on fly Delta sequences. A shorter variant (T58897) was also identified. C-Delta-1 expression appears to be the earliest known marker for prospective neurons. Mouse (T58899) and human (T58900, T59454) Delta-1 sequences have also been isolated. Delta-1 genes can be used in the prodn. of Delta polypeptides and (including antisense sequences) utilised in the treatment of disorders of cell fate or differentiation, such as cancer, and nervous system disorders, or to promote tissue

A longer variant (T58898) was also identified. C-Delta-1 expression appears to be the earliest known marker for prospective neurons. Mouse (T58899) and human (T58900, T59454) Delta-1 sequences have also been isolated. Delta-1 genes can be used in the prodn. of Delta polypeptides and (including antisense sequences) utilised in the treatment of disorders of cell fate or differentiation, such as

The present sequence encodes a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement blood formation, e.g. after immunosuppression.

The M-delta-1 gene (T58899) codes for the mouse homologue (W11720) cof brosophila Delta. a protein that binds to whoch protein. It was obtd. by PCR amplification of cDMA derived from 8.5 to 9.5-day mouse embryos using primers (see also T59457-58) based on Delta and ECF-1ike repeat sequences. M-Delta-1 is primarily expressed in the presomitic mesoderm, central nevous system, peripheral nervous system, and kidney. Chick (T58897-98) and human (T5890).

T59454) Delta-1 sequences have also been isolated. Delta-1 genes can be used in the prodn. of Delta polypeptides and (including antisense sequences) utilised in the treatment of disorders of cell facte or differentiation, such as cancer, and nervous system

Neurogenesis; EGF-like repeats; epidermal growth factor; TAGG embryonic CNS; leucine-rich repeat; Flank-LRR-Flank; glial cemotch; axonogenesis; cell-cell interaction; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      single reading frame gave a correct sequence for the H-Delta-1 protein. Predicted amino acid sequences for all 3 reading frames (W11725-27) were detd. and sequences (W11728-38) showing homology to chick and mouse Delta-1 (W11719-20) sequences were identified. The H-delta-1 gene can be used in the prodn. of H-Delta-1 polypeptides and (including antisense sequences) used to treat disorders of cell fate or differentiation, such as cancer, and
